## What is Tramadol?

Tramadol is a synthetic opioid analgesic, primarily prescribed to manage moderate to moderately severe pain. It works by affecting chemicals in the brain that signal pain, providing effective relief without some of the intense side effects of stronger opioids.

### Key Uses of Tramadol:

- Chronic pain conditions such as arthritis or back pain
- Post-surgical or injury-related pain
- Occasional acute pain management

Tramadol is often favored for its relatively lower risk of dependence compared to stronger opioids when used responsibly and under guidance.
